General Design Principles

Open-Closed Principle

The principle urges OO designers to meet two criteria:

- **Open to extension:** the system can be extended to meet new requirements.

Principle (Dependency Inversion Principle (DIP) /Inversion of Control)

*High level modules should not depend upon low level modules. Both should depend upon abstractions.
Abstractions should not depend upon details. Details should depend upon abstractions.*

Principle (Dependency Inversion Principle (DIP) /Inversion of Control)

*High level modules should not depend upon low level modules. Both should depend upon abstractions.
Abstractions should not depend upon details. Details should depend upon abstractions.*

This defines a very powerful rule for designing and programming: **Design to an interface, not an implementation**

Principle (Dependency Inversion Principle (DIP) /Inversion of Control (2))

Packages that are maximally stable should be maximally abstract. Instable packages should be concrete. The abstraction of a package should be in proportion to its stability.

Principle (Open Design)

The principle of open design states that the security of a mechanism should not depend on the secrecy of its design or implementation.

- This principle suggests that complexity does not add security

Principle (Open Design)

The principle of open design states that the security of a mechanism should not depend on the secrecy of its design or implementation.

- This principle suggests that complexity does not add security
- If the strength of the program's security depends on the ignorance of the user, a knowledgeable user can defeat that security mechanism ("security through obscurity")

Principle (Open Design)

The principle of open design states that the security of a mechanism should not depend on the secrecy of its design or implementation.

- This principle suggests that complexity does not add security
- If the strength of the program's security depends on the ignorance of the user, a knowledgeable user can defeat that security mechanism ("security through obscurity")
- This is especially true of cryptographic software and systems (algorithms kept secret)
