McMaster University Department of Computing and Software Dr. W. Kahl

COMPSCI&SFWRENG 2DM3 Textbook

Outline 2019-09-03

Discrete Mathematics and Applications I

COMPSCI&SFWRENG 2DM3 — Fall 2019

Instructor: Dr. Wolfram Kahl, Department of Computing and Software, ITB-245

E-Mail: kahl@cas.mcmaster.ca

Office Hours: Preliminary: Wed. 14:00–15:00, and by appointment.

Calendar Description:

Functions, relations and sets; the language of predicate logic, propositional logic; proof techniques, counting principles; induction and recursion, discrete probabilities, graphs, and their application to computing.

Goals:

This course will teach the mathematical foundations of computer science.

To a large degree, this can be seen as analogous to acquiring language skills. including knowledge and skills concerning syntax, semantics, pragmatics, and vocabulary of the language of (discrete) mathematics.

Conscious and precise use of this language is the foundation for precise specification and rigorous reasoning, which take a central place in this course.

Course Page: http://www.cas.mcmaster.ca/~kahl/CS2DM3/2019/

While most of the internal electronic information exchange for this course will be handled via Avenue, the course pages will contain useful links to external material, and will also serve as central fallback location for making information and material available outside Avenue, in particular in the case of Avenue accessibility problems. It is the student's responsibility to be aware of the information on the course Avenue site and on the course web page, and to check regularly for announcements (or RSS subscribe, where possible).

Schedule:

Lectures: Tuesday, Wednesday, Friday 12:30–13:20, CNH-104

Tutorials:

T1	Mo	15:30-16:20	JHE-210	T5	Fr	11:30-12:20	KTH-109
T2	Mo	13:30-14:20	JHE-210	T6	We	13:30-14:20	JHE-210
T3	Tu	10:30-11:20	JHE-210	T7	Mo	12:30-13:20	JHE-210
T4	Tu	13:30-14:20	JHE-210	Т8	Th	11:30-12:20	JHE-210

Tutorials start on Thursday of the first week, the 5th of September.

Students are expected to attend all lectures and tutorials.

"LADM": David Gries and Fred B. Schneider: A Logical Approach to Discrete Math, Springer 1993, ISBN 3-540-94115-0

"This is a rather extraordinary book, and deserves to be read by everyone involved in computer science and — perhaps more importantly — software engineering. I recommend it highly [...]. If the book is taken seriously, the rigor that it unfolds and the clarity of its concepts could have a significant impact on the way in which software is conceived and developed."

— Peter G. Neumann

Additional material will be made available electronically via the course pages.

Outline:

(With the most relevant textbook chapters indicated — not all textbook contents will be covered in detail, and material will be interleaved heavily. Times are rough estimates.)

• Introduction to Calculational Reasoning Boolean Expressions and Propositional Logic Quantification and Predicate Logic	Parts of Chapters 1, 15 Chapters 1–5 Chapters 8–9	≈ 4 weeks
• Predicates and Programming	Chapter 10	≈ 1 week
SetsRelations and Functions	Chapter 11 Chapter 14	≈ 1 week ≈ 2 weeks
Induction and SequencesGraphs, Counting	Chapters 12–13 Chapters 19, 16	≈ 1.5 weeks ≈ 2.5 weeks

Using tool support will be part of the expectations; details to be announced.

Exercises and Tutorials:

In most weeks, Exercises will be provided, from which the main material for the tutorials will be taken.

Every week (runnig Thursday to Wednesday), starting September 5, there will be one-hour tutorial session in eight tutorial groups. The main purpose of the tutorials is to discuss student work on exercise problems. Therefore, every student is expected to complete the scheduled work, i.e., exercise problems or necessary reading, **before** the corresponding tutorial session — in particular, solutions and solution attempts to the Exercises of the current week are to be brought to the tutorial.

Since space in the tutorial rooms is limited, the TAs are under strict guidelines to ask students not registered for the currently-scheduled tutorial group to leave if the tutorial room is overcrowded.

Grading:

All examinations in this course will be **Closed Book**. That is, no written or printed material nor a calculator nor other electronic aids except for the tools specified for use in each exam may be used during the examinations.

After notations, presentation rules, and basic definitions and proof rules have been introduced in class, **students are expected to know them at all times**.

<u>Assignments:</u> There will be graded **Assignments** essentially on a weekly basis. ("Exercises" are ungraded.)

Assignments may be graded only automatically and/or summarily; evaluation will be conducted mostly via the midterm tests and the final.

It is essential that you meet the deadlines for the assignments; there is no credit for material submitted after the deadline.

<u>Homework:</u> In addition, there will be graded **Homework Questions** that need to be answered via CalcCheck essentially from one lecture to the next.

The detailed arrangements may be changed during the term; for the start of the term, the following rules will be used:

- If on the day of a lecture at 5 p.m. no homework has been announced on Avenue, then there will be no homework due before the next lecture.
- If homework is announced, it will be due by 10:30 a.m. on the day of the next lecture.

Homework questions will typically be graded only automatically, and possibly more summarily than weekly assignments.

There is no credit for submissions after the deadline.

<u>Midterms:</u> There will be **two midterm examinations**. These will be 90-minute closed-book exams written **in computer labs using CalcCheck tool support** on the computers. Due to lab availability, the midterms will be **most likely** be written within the following time slots (**to be confirmed on Avenue!**):

Midterm 1: Friday, 4th October 17:45 to 19:30 **Midterm 2**: Friday, 15th November 17:45 to 19:30

You will receive an e-mail specifying your lab and seat number the night before each midterm.

Final Exam: The final examination will be scheduled by the Registrar's Office in the usual way. It will be a closed-book examination of 2.5 hours (150 minutes) duration and cover the material of all lectures, tutorials, handouts, and assignments. The current hope is that the final exam will be written in computer labs using tool support on the computers, but it may turn out that this will not be possible due to organisational reasons beyond the control of the instructor.

Grade Calculation: All exam grades will be percentage grades.

For every student, the course grade is calculated as a weighted average:

• For k being the number of **lectures with homework assigned** this course will have had, 8% of the weight are given to your $\lceil \frac{7}{8} \cdot k \rceil - 1$ best homework submissions. This allows you to miss probably at least 3 homework submissions

- there will be no further accommodations for missed homework. (In particular, MSAFs for homework will not be processed.)
- For n being the number of **weekly assignments** this course will have had, 12% of the weight are given to your (n-2) best assignments. This allows you to miss 2 weekly assignments there will be **no further accommodations for missed weekly assignments**. (In particular, MSAFs for weekly assignments will not be processed.)

Some assignments may contain **bonus questions**. All bonus marks will be added to the course grade *only for those who have passed the course otherwise*.

- Those **midterms** where your result is better than your result in the final count 20% each, and those midterms that are not better than the final count 12% each.
- The remaining weight (between 40% and 56%) is given to the **final exam**.

The final course grade will be converted from a percentage grade to a letter grade according to the scale of the Registrar's Office.

The instructor reserves the right to conduct any deferred midterm or final exams orally.

Course Adaptation

The instructor and university reserve the right to modify elements of the course during the term.

The University reserves the right to change the dates and deadlines for any or all courses in extreme circumstances (e.g., severe weather, labour disruptions, etc.). Changes will be communicated through regular McMaster communication channels, such as McMaster Daily News, A2L and/or McMaster email.

It is the responsibility of the student to check their McMaster email and course websites frequently during the term and to note any changes.

The current plan is to have all midterms and the final written on computers using CalcCheck tool support. It is not yet certain whether this will be feasible for the final, as mentioned above. In addition, in case of system/network outages, exams written in the computer labs may still need to be (partially) written by hand.

Therefore, you need to be both fluent in producing formalisations and proofs using the CalcCheck tool and fluent in writing syntactically correct formalisations and proofs by hand.

Academic Integrity

You are expected to exhibit honesty and use ethical behaviour in all aspects of the learning process. Academic credentials you earn are rooted in principles of honesty and academic integrity.

Academic dishonesty is to knowingly act or fail to act in a way that results or could result in unearned academic credit or advantage. This behaviour can result in serious consequences, e.g. the grade of zero on an assignment, loss of credit with a notation on the transcript (notation reads: "Grade of F assigned for academic dishonesty"), and/or suspension or expulsion from the university.

It is your responsibility to understand what constitutes academic dishonesty. For information on the various types of academic dishonesty please refer to the Academic Integrity Policy, located at http://www.mcmaster.ca/academicintegrity.

The following illustrates only four forms of academic dishonesty:

- 1. Plagiarism, i.e., the submission of work that is not one's own or for which other credit has been obtained.
- 2. Collaboration where individual work is expected.
- 3. Accessing another students' Avenue account, or providing others access to your Avenue account.

You have to produce your submissions for assignment questions yourself, and without collaboration.

For each assignment question there will normally be exercise questions similar to it — you are allowed to collaborate on these exercise questions. (The tutorials are typically not expected to cover all exercise questions.)

- 4. Improper collaboration in group work.
- 5. Copying or using unauthorised aids in tests and examinations.

Requests for Relief for Missed Academic Term Work

In the event of an absence for medical or other reasons, students should review and follow the Academic Regulation in the Undergraduate Calendar "Requests for Relief for Missed Academic Term Work".

Academic Accommodation of Students with Disabilities

Students who require academic accommodation must contact Student Accessibility Services (SAS) to make arrangements with a Program Coordinator. Academic accommodations must be arranged for each term of study. Student Accessibility Services can be contacted by phone 905-525-9140 ext. 28652 or e-mail sas@mcmaster.ca. For further information, consult McMaster University's Policy for Academic Accommodation of Students with Disabilities.

Academic Accommodation for Religious, Indigenous or Spiritual Observances (RISO)

Students requiring academic accommodation based on religious, indigenous or spiritual observances should follow the procedures set out in the RISO policy. Students requiring a RISO accommodation should submit their request to their Faculty Office normally within 10 working days of the beginning of term in which they anticipate a need for accommodation or to the Registrar's Office prior to their examinations. Students should also contact their instructors as soon as possible to make alternative arrangements for classes, assignments, and tests.

Discrimination

The Faculty of Engineering is concerned with ensuring an environment that is free of all adverse discrimination. If there is a problem that cannot be resolved by discussion among the persons concerned, individuals are reminded that they should contact the Department Chair, the Sexual Harassment Office or the Human Rights Consultant, as soon as possible.

Use of Avenue

In this course we will be using "Avenue to Learn". Students should be aware that, when they access the electronic components of this course, private information such as first and last names, user names for the McMaster e-mail accounts, and program affiliation may become apparent to all other students in the same course. The available information is dependent on the technology used. Continuation in this course will be deemed consent to this disclosure. If you have any questions or concerns about such disclosure please discuss this with the course instructor.

Learning Objectives

Course Precondition

Students are expected to have achieved the following learning objectives before taking this course:

- 1. Students should know and understand
 - a) Basic number types, such as integers, rationals, reals
 - b) General principles of mathematical notation
 - c) General principles of calculation in mathematics
 - d) Basic imperative programming
- 2. Students should be able to
 - a) Perform calculations and solve equations in numerical domains
 - b) Write and "mentally execute" simple imperative programs

Course Postcondition

Students are expected to achieve the following learning objectives as a result of taking this course:

- 1. Students should know and understand
 - a) Syntax of propositional logic
 - b) Syntax of predicate logic, including variable binding issues
 - c) Principles of typed expressions, and the types of the operators they are using
 - d) Basic semantics of expressions and formulae (truth tables, validity, ...)
 - e) Principles of calculational proofs
 - f) Basic and derived proof rules of propositional logic
 - g) Basics of (typed) set theory
 - h) Basic concepts and theorems about functions and (especially binary) relations
 - i) Basics of program specification using pre- and postconditions
 - j) Basic theory of integers and counting
 - k) Basic graph theory

2. Students should be able to

- a) Extract the propositional-logic structure from English sentences, and translate propositional expressions back into English
- b) Translate English statements of moderate complexity into predicate-logic specification
- c) Translate simple mathematical prose into predicate-logic definitions and formulae
- d) Produce calculational proofs in propositional logic
- e) Explain and prove basic properties using induction
- f) Produce correctness proofs for simple imperative programs.
- g) Produce calculational proofs in applications to set and relation theory, integers and counting, etc.
- h) Explain and prove basic graph properties.

Coverage of Graduate Attribute Indicators by Learning Outcomes (Preliminary)

For each indicator, the learning outcome topics (defined in the rubrics below) used to measure it are indicated:

1 (A knowledge base for engineering)

1.1 (Competence in Mathematics)

- Logical Formalism
- Calculational Proofs in Propositional Logic
- Calculational Proofs in Predicate Logic Applications
- Induction
- Program correctness proofs
- Formalisation
- Discrete Structures: Sets, Functions, Relations, Graphs, Counting

Learning Outcomes Rubric (Preliminary)

Topic	Below	Marginal	Meets	Exceeds
Logical Formalism	when writing formulae, frequently	writes mostly syntactically cor-	writes syntactically and type-	can explain typing and variable
	introduces syntax or type errors	rect formulae with occasional	correct formulae, and correctly re-	binding issues with good under-
		type errors	names variables when substitut-	standing
			ing	
Calculational Proofs in	cannot produce correct calcula-	typically makes about one mis-	normally produces correct proof	confidently produces even more
Propositional Logic	tional proofs even for simple the-	take every three proof steps	calculations, but may not succeed	complex propositional-logic
	orems		with more complex tasks, or take	proofs
			unnecessary detours	
Calculational Proofs in Pred-	cannot produce correct calcula-	shows some ability to apply	correctly applies predicate-logic	correctly applies predicate-logic
icate Logic Applications	tional proof steps using predicate-	predicate-logic proof rules in sim-	proof rules in simple contexts, and	proof rules also in more complex
	logic proof rules even in simple	ple contexts	can at least attempt to tackle	settings
	contexts		more complex settings	
Induction	cannot handle even simple induc-	can mostly produce simple rou-	confidently performs simple and	handles even complex induction
	tion proofs	tine induction proofs	nested induction proofs	settings confidently
Program correctness proofs	cannot handle even simple pro-	can mostly produce simple rou-	confidently produces program	handles even nested program
	gram correctness proofs; does not	tine program correctness proofs	correctness proofs for simple	structures confidently, and iden-
	propose useful invariants	and proposes mostly-appropriate	programs and identifies sufficient	tifies appropriate invariants even
		invariants	invariants	in settings that require more un-
				derstanding
Formalisation	cannot handle even simple formal-	can produce simple formalisations	confidently performs simple for-	produces reasonable formalisa-
	isation tasks	that mostly capture the natural-	malisation tasks, but may not be	tions even for moderately more
		language meaning	able to cope with more complex	complex tasks
Discrete Structures: Sets,	demonstrates handly any under	lmores and can apply some basis	tasks	demonstrates a solid understand-
1	demonstrates hardly any under-	knows and can apply some basic	knows and can apply the majority
