

# "The Elements of Java Style"

COMP SCI / SFWR ENG 2S03

Natalie Perna

Department of Computing and Software  
McMaster University

Week 2: Sept 17 - 21

# Outline

- 1 Resource
- 2 Disclaimer
- 3 Formatting
  - Indentation
  - White Space
- 4 Naming
  - General Rules
  - Classes
  - Methods
  - Variables
  - Fields and Parameters
  - Constants
- 5 Documentation
  - Documentation Comments
  - Standard Comments

# Resource

All of the following material is adapted from:  
*Vermeulen, Ambler, Bumgardner, et al. "The Elements of Java Style". Cambridge New York: Cambridge University Press SIGS Books, 2000.*

# Disclaimer

Most rules are not covered in their entirety throughout these slides. Reference "The Elements of Java Style" for full details, including exceptions to some of the rules stated here.

# Indentation

- Improves code readability
- Use 2 spaces (or indentation style produced by IDE)
- Do *not* use tabs
- '{' at end of first line of block; '}' on own line at end of block

```
class MyClass {
**void function(int arg) {
****if (arg < 0) {
*****for (int i = 0; i <= arg; i++) {
*****// Code here
*****}
****}
**}
}
```

# Single Spaces

To separate:

- ')' or '}' from keyword that immediately follows
- '(' or '{' from keyword that immediately precedes
- ')' from '{' that immediately follows
- Binary operator (except ".") from expressions preceding and following

```
if *(x**+*y*>*0)*{  
    ...  
}  
else *if *(x**+*y*<*0)*{  
    ...  
}  
else *{  
    ...  
}
```

# Blank Lines I

To separate:

- Logical sections of a method
- Members of a class/interface definition

# Blank Lines II

```
void handleMessage(Message message) {  
  
    DataInput content = message.getDataInput();  
    int messageType = content.readInt();  
  
    switch (messageType) {  
  
        case WARNING:  
            ... do some stuff here ...  
            break;  
  
        default:  
            ... do some stuff here ...  
            break;  
  
    }  
}
```

# General Rules I

- Use meaningful names (i.e. "age" is more meaningful than "a")
- Exception: Some temporary variables (i.e. "i" for an loop index/counter)
- Use constants for values that can be meaningfully described

# General Rules II

Example:

```
if (a < 65) { // What property does 'a' describe?
  y = 65 - a; // What is being calculated here?
}
else {
  y = 0;
}
```

vs.

```
if (age < RETIREMENT_AGE) {
  yearsToRetirement = RETIREMENT_AGE - age;
}
else {
  yearsToRetirement = 0;
}
```

## General Rules III

- Tip: If you can't describe your object with a short, simple name, you may be trying to accomplish too much with a single object
- Do not shorten words or remove vowels (i.e. use "message" not "msg")
- Capitalize first letter only in acronyms (i.e. use "importHtml" not "importHTML")

# Classes

- Capitalize the first letter of each word (i.e. "FilterOutputStream")
- Use nouns (remember that classes define objects) (i.e. "CustomerAccount")

# Methods

- First letter should be lowercase (i.e. "deposit")
- Each subsequent word in the name begins with a capital letter (i.e. "withdrawFromSavings")
- Use verbs (remember that methods define actions)
- Name accessor methods using "is", "get", "set"

# Variables

- First letter should be lowercase (i.e. "address")
- Each subsequent word in the name begins with a capital letter (i.e. "billingAddress")
- Use nouns (remember that variables refer to objects) (i.e. "shippingAddress")
- Pluralize names of collection references (i.e. `Customer[]`  
`customers = newCustomer[MAX_CUSTOMERS];`)

# Fields I

- Qualify field variables with "this" keyword to distinguish from local variables
- When a constructor or "set" method assigns a parameter to a field, give that parameter the same name as the field.

# Fields II

```
class Dude {  
  
    private String name;  
  
    public Dude(String name) {  
        this.name = name;  
    }  
  
    public setName(String name) {  
        this.name = name;  
    }  
}
```

# Constants

- Use all uppercase letters (i.e. "AGE")
- Separate words with an underscore (i.e. "MAX\_AGE")

# Documentation Comments

- Begins with `/**` and ends with `*/`
- Used to describe programming interface

```
/**  
 * The Rectangle2D class describes  
 * a rectangle defined by location (x,y) and  
 * dimensions (w,h).  
 */  
public abstract class Rectangle2D  
  extends RectangularShape {  
    // ... Class contents here ...  
  }
```

# Standard Comments

- Begins with `"/*` and ends with `*/`
- Used to (temporarily) hide code without removing it

```
/*  
 I have temporarily removed this method because  
 it has been deprecated for some time, and I  
 want to determine whether any other packages  
 are still using it! – J. Kirk on 9 Dec 1997  
  
public void thisOldFunction() {  
    // There has got to be a better way!  
    ...  
}  
*/
```

# One-Line Comments

- Begins with `“//”`
- Single line or end-line
- Used to explain implementation details:
  - The purpose of specific variables or expressions
  - Implementation-level design decisions
  - The source material for complex algorithms
  - Defect fixes or workarounds
  - Code that may benefit from further optimization or elaboration
  - Known problems, limitations, or deficiencies
