# **Chapter 4**

# **Shared Objects & Mutual Exclusion**

# **Shared Objects & Mutual Exclusion**

Concepts: process interference.

mutual exclusion.

Models: model checking for interference

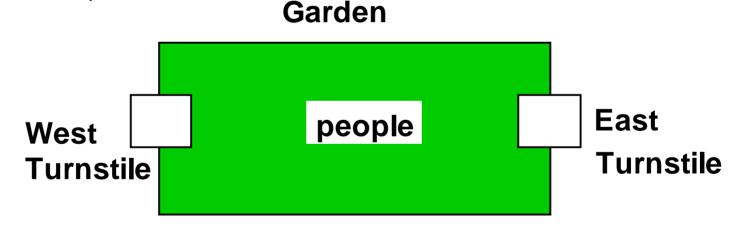

modeling mutual exclusion

Practice: thread interference in shared Java objects mutual exclusion in Java (synchronized objects/methods).

#### 4.1 Interference

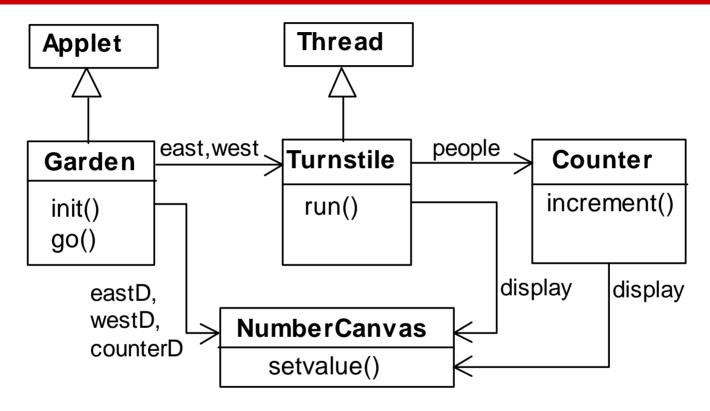

# Ornamental garden problem:

People enter an ornamental garden through either of two turnstiles. Management wish to know how many are in the garden at any time.

The concurrent program consists of two concurrent threads and a shared counter object.

# ornamental garden Program - class diagram

The **Turnstile** thread simulates the periodic arrival of a visitor to the garden every second by sleeping for a second and then invoking the **increment()** method of the counter object.

#### ornamental garden program

The **Counter** object and **Turnstile** threads are created by the **go()** method of the Garden applet:

```
private void go() {
   counter = new Counter(counterD);
   west = new Turnstile(westD,counter);
   east = new Turnstile(eastD,counter);
   west.start();
   east.start();
}
```

Note that **counterD**, **westD** and **eastD** are objects of **NumberCanvas** used in chapter 2.

#### **Turnstile class**

```
class Turnstile extends Thread {
  NumberCanvas display;
  Counter people;
                                                   The run()
                                                   method exits
  Turnstile(NumberCanvas n,Counter c)
                                                   and the thread
    { display = n; people = c; }
                                                   terminates after
  public void run() {
                                                   Garden MAX
    try{
                                                   visitors have
      display.setvalue(0);
                                                   entered.
      for (int i=1;i<=Garden.MAX;i++){</pre>
         Thread.sleep(500); //0.5 second between arrivals
         display.setvalue(i);
        people.increment();
    } catch (InterruptedException e) {}
```

#### Counter class

```
class Counter {
  int value=0;
  NumberCanvas display;
  Counter(NumberCanvas n) {
    display=n;
    display.setvalue(value);
  void increment() {
    int temp = value; //read value
    Simulate.HWinterrupt();
    value=temp+1;  //write value
    display.setvalue(value);
```

Hardware interrupts can occur at **arbitrary** times.

The counter simulates a hardware interrupt during an increment(), between reading and writing to the shared counter value.

Interrupt randomly calls Thread.sleep() to force a thread switch.

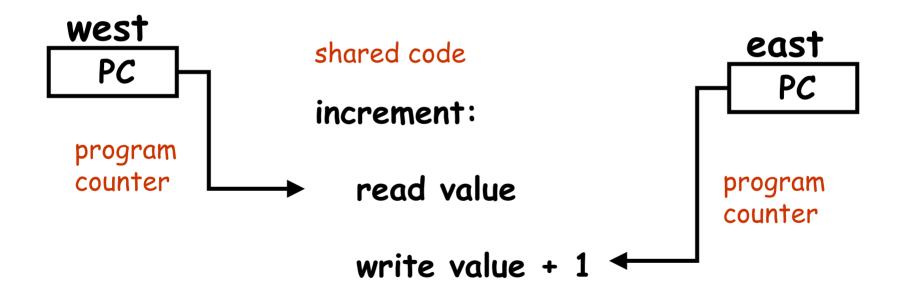

### ornamental garden program - display

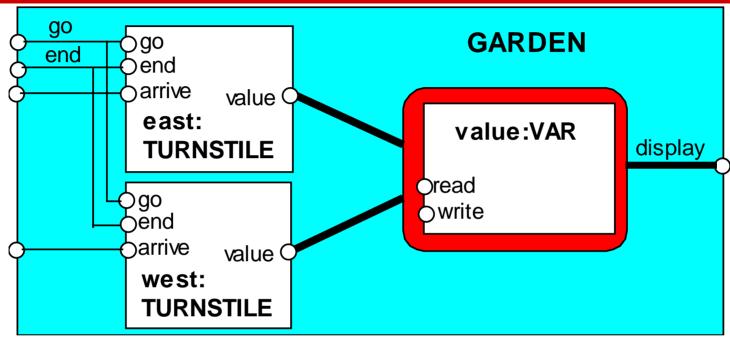

After the East and West turnstile threads have each incremented its counter 20 times, the garden people counter is not the sum of the counts displayed. Counter increments have been lost. Why?

#### concurrent method activation

Java method activations are not atomic - thread objects east and west may be executing the code for the increment method at the same time.

### ornamental garden Model

Process VAR models read and write access to the shared counter value.

Increment is modeled inside TURNSTILE since Java method activations are not atomic i.e. thread objects east and west may interleave their read and write actions.

### ornamental garden model

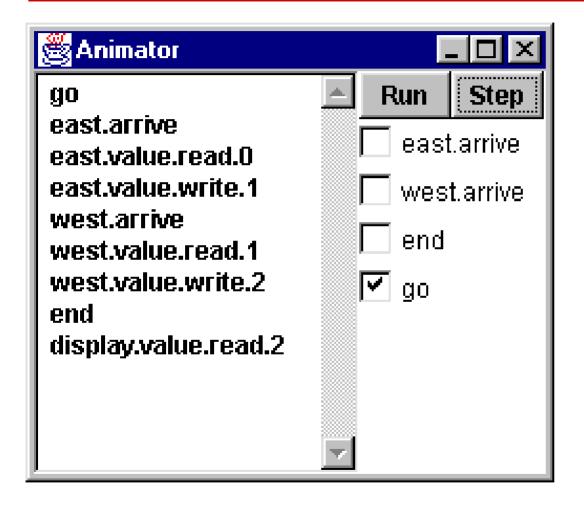

```
const N = 4
range T = 0..N
set VarAlpha = { value.{read[T],write[T]} }
VAR = VAR[0],
VAR[u:T] = (read[u] ->VAR[u]
          |write[v:T]->VAR[v]).
TURNSTILE = (go -> RUN),
         = (arrive-> INCREMENT
RUN
           end -> TURNSTILE),
INCREMENT = (value.read[x:T]
            -> value.write[x+1]->RUN
           )+VarAlpha.
||GARDEN = (east:TURNSTILE || west:TURNSTILE
          /{ go /{ east, west} .go,
            end/{ east,west} .end} .
```

The alphabet of shared process **VAR** is declared explicitly as a **set** constant, **VarAlpha**.

The TURNSTILE
alphabet is extended
with VarAlpha to
ensure no unintended
free (autonomous)
actions in VAR eg.
value.write[0].
All actions in the
shared VAR must be
controlled (shared) by
a TURNSTILE.

Concurrency: shared objects & mutual exclusion

# checking for errors - animation

Scenario checking - use animation to produce a trace.

Is this trace correct?

# checking for errors - exhaustive analysis

Exhaustive checking - compose the model with a TEST process which sums the arrivals and checks against the display value:

```
TEST = TEST[0],
TEST[v:T] =
    (when (v<N){east.arrive,west.arrive}->TEST[v+1]
    |end->CHECK[v]
    ),
CHECK[v:T] =
    (display.value.read[u:T] ->
          (when (u==v) right -> TEST[v]
          |when (u!=v) wrong -> ERROR
    )
)+{display.VarAlpha}.
Like STOP, ERROR is a predefined FSP local process (state), numbered -1 in the equivalent LTS.
```

### ornamental garden model - checking for errors

```
| TESTGARDEN = (GARDEN | TEST).
```

Use LTSA to perform an exhaustive search for ERROR.

```
Trace to property violation in TEST:

go
east.arrive
east.value.read.0
west.arrive
west.value.read.0
east.value.write.1
wrong

LTSA produces
the shortest
path to reach
ERROR.
```

#### **Interference and Mutual Exclusion**

Destructive update, caused by the arbitrary interleaving of read and write actions, is termed *interference*.

Interference bugs are extremely difficult to locate. The general solution is to give methods mutually exclusive access to shared objects. Mutual exclusion can be modeled as atomic actions.

#### 4.2 Mutual exclusion in Java

Concurrent activations of a method in Java can be made mutually exclusive by prefixing the method with the keyword **synchronized**, which uses a lock on the object.

We correct **COUNTER** class by deriving a class from it and making the increment method **synchronized**:

### mutual exclusion - the ornamental garden

Java associates a *lock* with every object. The Java compiler inserts code to acquire the lock before executing the body of the synchronized method and code to release the lock before the method returns. Concurrent threads are blocked until the lock is released.

# Java synchronized statement

Access to an object may also be made mutually exclusive by using the **synchronized** statement:

```
synchronized (object) { statements }
```

A less elegant way to correct the example would be to modify the **Turnstile.run()** method:

```
synchronized(people) {people.increment();}
```

Why is this "less elegant"?

To ensure mutually exclusive access to an object, all object methods should be synchronized.

# 4.3 Modeling mutual exclusion

To add locking to our model, define a LOCK, compose it with the shared VAR in the garden, and modify the alphabet set:

# Modify TURNSTILE to acquire and release the lock:

### Revised ornamental garden model - checking for errors

A sample animation execution trace

```
qo
east.arrive
east.value.acquire
east.value.read.0
east.value.write.1
east.value.release
west.arrive
west.value.acquire
west.value.read.1
west.value.write.2
west.value.release
end
display.value.read.2
right
```

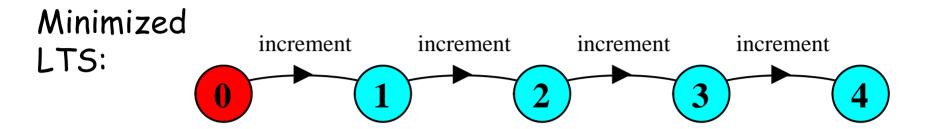

Use TEST and LTSA to perform an exhaustive check.

# **COUNTER:** Abstraction using action hiding

```
directly in terms of their
const N = 4
                                      synchronized methods, we
range T = 0..N
                                      can abstract the details by
                                      hiding.
VAR = VAR[0],
VAR[u:T] = (read[u]->VAR[u]
                                      For SynchronizedCounter
              write[v:T]->VAR[v]).
                                      we hide read, write,
LOCK = (acquire->release->LOCK).
                                      acquire, release actions.
INCREMENT = (acquire->read[x:T]
              -> (when (x<N) write[x+1]
                   ->release->increment->INCREMENT
              )+{read[T],write[T]}.
| | COUNTER = (INCREMENT | | LOCK | | VAR)@{increment}.
```

To model shared objects

# **COUNTER:** Abstraction using action hiding

We can give a more abstract, simpler description of a COUNTER which generates the same LTS:

```
COUNTER = COUNTER[0]
COUNTER[v:T] = (when (v<N) increment -> COUNTER[v+1]).
```

This therefore exhibits "equivalent" behavior i.e. has the same observable behavior.

# **Summary**

- ◆ Concepts
  - process interference
  - mutual exclusion
- ◆ Models
  - model checking for interference
  - modeling mutual exclusion
- ◆ Practice
  - thread interference in shared Java objects
  - mutual exclusion in Java (synchronized objects/methods).
