Programming Abstraction in C++

Eric S. Roberts and Julie Zelenski

Stanford University 2010

Chapter 5. Introduction to Recursion

Outline

- 2 Fibonacci Sequence
- 3 Additive Sequences
- Other Examples
- 5 Binary Search

Introduction

A technique in which large problems are solved by reducing them to smaller problems of the same form.

Introduction

A technique in which large problems are solved by reducing them to smaller problems of the same form.

What is large? What is small?

A measurement of the size of the problem.

Introduction

A technique in which large problems are solved by reducing them to smaller problems of the same form.

What is large? What is small?

A measurement of the size of the problem.

The smaller problems must be of the same form as the large problem.

- 5 Binary Search
- 6 Mutual Recursion

▲□▶▲@▶▲≣▶▲≣▶ = ● ● ●

Factorial function

The function f(n) = n!.

Function prototype

```
int Fact(int n);
```

An iterative (nonrecursive) implementation

```
int Fact(int n) {
    int product;
    product = 1;
    for (int i = 1; i <= n; i++) {
        product *= i;
     }
     return product;
}</pre>
```

Factorial function (cont.)

The recursive formulation: n! = n * (n - 1)!

A large problem (size *n*) is reduced to a smaller problem (size n - 1) of the same form (factorial).

Stopping point (simple case, trivial case): 0! = 1

Factorial function (cont.)

The recursive formulation: n! = n * (n - 1)!

A large problem (size *n*) is reduced to a smaller problem (size n - 1) of the same form (factorial).

Stopping point (simple case, trivial case): 0! = 1

A recursive definition

$$n! = \begin{cases} 1 & \text{if } n = 0\\ n(n-1)! & \text{otherwise} \end{cases}$$

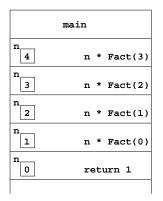

A recursive implementation

```
int Fact(int n) {
    if (n == 0) {
        return 1;
    } else {
        return n * Fact(n-1);
    }
}
```

◆□▶ ◆□▶ ◆三▶ ◆三▶ ●□ ● ●

Tracing the recursive process

f = Fact(4)

A stack of frames.

Outline

- 2 Fibonacci Sequence
- 3 Additive Sequences
- 4 Other Examples
- 5 Binary Search
- 6 Mutual Recursion

Fibonacci sequence

The sequence: t_0, t_1, t_2, \dots

$$t_n = t_{n-1} + t_{n-2}, \quad t_0 = 0, \ t_1 = 1.$$

◆□▶ ◆□▶ ◆三▼ ▲□▶ ▲□

Fibonacci sequence

The sequence: t_0, t_1, t_2, \dots

$$t_n = t_{n-1} + t_{n-2}, \quad t_0 = 0, \ t_1 = 1.$$

A recursive definition

$$t_n = \begin{cases} n & \text{if } n \text{ is } 0 \text{ or } 1 \\ t_{n-1} + t_{n-2} & \text{otherwise} \end{cases}$$

・ロト・日本・日本・日本・日本・

Fibonacci sequence (cont.)

Function prototype

```
int Fib(int n);
```

A recursive implementation

```
int Fib(int n) {
    if (n < 2) {
        return n;
    } else {
        return (Fib(n - 1) + Fib(n - 2));
    }
}</pre>
```

▲□▶▲圖▶▲≧▶▲≧▶ 差 のへで

Additive sequence

A generalization of the Fibonacci sequence.

Given t_0 and t_1 , $t_n = t_{n-1} + t_{n-2}$.

Function prototype

AdditiveSequence(int n, int t0, int t1);

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Additive sequence

A generalization of the Fibonacci sequence.

Given t_0 and t_1 , $t_n = t_{n-1} + t_{n-2}$.

Function prototype

AdditiveSequence(int n, int t0, int t1);

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ ● ●

The Fibonacci sequence is a special case where $t_0 = 0$ and $t_1 = 1$.

Wrapper function

```
int Fib(int n) {
    return AdditiveSequence(n, 0, 1)
}
```

An observation:

The *n*th term in an additive sequence

 $\mathit{t}_0, \mathit{t}_1, \mathit{t}_2, \mathit{t}_3, \ldots$

is the (n-1)st term in the additive sequence

$$t_1, t_2, t_3, \dots \quad t_2 = t_0 + t_1$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

An observation:

The *n*th term in an additive sequence

 $\mathit{t}_0, \mathit{t}_1, \mathit{t}_2, \mathit{t}_3, \ldots$

is the (n-1)st term in the additive sequence

$$t_1, t_2, t_3, \dots \quad t_2 = t_0 + t_1$$

Implementation

```
int AdditiveSequence(int n, int t0, int t1) {
    if (n == 0) return t0;
    if (n == 1) return t1;
    return AdditiveSequence(n-1, t1, t0 + t1);
}
```

Still a recursion, but no redundant calls!

An observation:

The *n*th term in an additive sequence

 $\mathit{t}_0, \mathit{t}_1, \mathit{t}_2, \mathit{t}_3, \ldots$

is the (n-1)st term in the additive sequence

$$t_1, t_2, t_3, \dots \quad t_2 = t_0 + t_1$$

Implementation

```
int AdditiveSequence(int n, int t0, int t1) {
    if (n == 0) return t0;
    if (n == 1) return t1;
    return AdditiveSequence(n-1, t1, t0 + t1);
}
```

Still a recursion, but no redundant calls! Question: What happens if the if (n == 1) check is missing?

What makes the difference?

What makes the difference?

• Fib(int n) on p. 184 makes two overlapping recursive calls;

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

• Fib(int n) on p. 186 makes one recursive call.

What makes the difference?

• Fib(int n) on p. 184 makes two overlapping recursive calls;

• Fib(int n) on p. 186 makes one recursive call.

Note. Deep recursion can cause stack overflow.

Palindrome

A recursive formulation

- The first and last characters are the same.
- The substring generated by removing the first and last is a Palindrome.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● □ ●

Palindrome

A recursive formulation

- The first and last characters are the same.
- The substring generated by removing the first and last is a Palindrome.

Stopping points (trivial cases, simple cases):

Since we remove two characters (first and last) at a time, we end up with either a single-character string or an empty string.

Palindrome (cont.)

An implementation

Improving efficiency

Using

- the positions of the first and last in the currently active substring.
- a wrapper.

Advantages of CheckPalindrome, p. 189:

- Calculate the length of the input string once;
- Avoid calling substr to make copy of substring.

IsPalindrome, Figure 5-4, p. 189.

Improving efficiency

Using

- the positions of the first and last in the currently active substring.
- a wrapper.

Advantages of CheckPalindrome, p. 189:

- Calculate the length of the input string once;
- Avoid calling substr to make copy of substring.

IsPalindrome, Figure 5-4, p. 189.

Why wrapper function?

Hide implementation. The interface of IsPalindrome is unlikely to be changed.

Search for an element in an integer array sorted in ascending order.

<ロ> < @> < @> < @> < @> < @> < @</p>

Search for an element in an integer array sorted in ascending order.

- A recursive formulation:
- Split the array in the middle, search the left half or right half depending on the given value.

Search for an element in an integer array sorted in ascending order.

A recursive formulation:

Split the array in the middle, search the left half or right half depending on the given value.

Stopping point

- The mid-entry is the element.
- No elements in the active part of the array.

Search for an element in an integer array sorted in ascending order.

A recursive formulation:

Split the array in the middle, search the left half or right half depending on the given value.

Stopping point

- The mid-entry is the element.
- No elements in the active part of the array.

Wrapper:

```
int FindIntInSortedArray(int key, int array[], int n) {
    return BinarySearch(key, array, 0, n-1);
}
```

Binary search (cont.)

- Factorial Function
- 2 Fibonacci Sequence
- 3 Additive Sequences
- Other Examples
- 5 Binary Search

Mutual recursion

A general recursion.

Example.

f calls g and g calls f.

Function IsEven, Figure 5-6, p. 192.

Mutual recursion (cont.)

```
bool IsEven(unsigned int n) {
    if (n == 0) {
        return true;
    } else {
        return IsOdd(n - 1);
    }
}
bool IsOdd(unsigned int n) {
    return !IsEven(n);
}
```

Mutual recursion (cont.)

```
bool IsEven(unsigned int n) {
    if (n == 0) {
        return true;
    } else {
        return IsOdd(n - 1);
    }
}
bool IsOdd(unsigned int n) {
    return !IsEven(n);
}
```

Questions:

What happens if if (n == 0) check is missing in IsEven? What happens if if (n == 1) check is added to IsOdd?

Thinking recursively

Your program should look like

Standard recursion paradigm

```
if (test for simple case) {
    solve simple case
} else {
    call this function with smaller size
}
```

Thinking recursively (cont.)

- Find out all possible simple cases (stopping points). The recursion should end with a simple case.
- Test your program for the simple (trivial) cases.
- Determine a measurement of the size of the problem.
 Decompose a big problem into smaller problems of the same form. Apply the recursive leap of faith to make sure your program generates the complete solution.
