Find roots

$$f(x) = 0$$

Often, methods are iterative (roots cannot be found in finite number of steps).

Example Compute square roots $x^2 - A = 0$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○ ◆

Find roots

$$f(x) = 0$$

Often, methods are iterative (roots cannot be found in finite number of steps).

Example

Compute square roots

$$x^2 - A = 0$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○ ◆

Find the side of the square whose area is A

Start with a rectangle whose one side is x_c , then the other side is A/x_c so that its area is A.

Make the rectangle "more square" by setting the new side:

$$x_{+} = \frac{1}{2} \left(x_{c} + \frac{A}{x_{c}} \right)$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○ ◆

Then $x_c = x_+$ and iterate.

Start with a rectangle whose one side is x_c , then the other side is A/x_c so that its area is A.

Make the rectangle "more square" by setting the new side:

$$x_{+} = \frac{1}{2} \left(x_{c} + \frac{A}{x_{c}} \right)$$

Then $x_c = x_+$ and iterate.

A better form

$$x_{+}=x_{c}-\frac{1}{2}\left(x_{c}-\frac{A}{x_{c}}\right)$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○ ◆

Three issues to be addressed

- Initialization (x_0)
- Convergence ($x_k \rightarrow x_*$?) and rate (how fast?)
- Termination

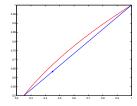

Intro	Bisection	Newton	Systems	Optimization	Software	Summary
Initial	ization					

Write A in base 4:

$$A = m imes 4^e$$
, $0.25 \le m < 1$

then $\sqrt{A} = \sqrt{m} \times 2^{e}$. Now we can assume $4^{-1} \le A < 1$. Linear interpolation of $f(A) = \sqrt{A}$ at A = 0.25, 1.0:

$$p(A) = (1 + 2A)/3$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○ ◆

Initial error bound: Differentiating

$$\sqrt{A} - \frac{1+2A}{3}$$

with respect to A and then setting the derivative to zero to find the maximum, it can be shown that

$$\left|\sqrt{A} - (1+2A)/3\right| \le 0.05$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○ ◆

Initial error bound: Differentiating

$$\sqrt{A} - \frac{1+2A}{3}$$

with respect to A and then setting the derivative to zero to find the maximum, it can be shown that

$$\left|\sqrt{A} - (1+2A)/3\right| \leq 0.05$$

Initial value: $x_0 = (1 + 2A)/3$ Initial error: $e_0 \le 0.05$

・ロト・日本・山田・ 山田・ 山口・

A relation between x_{k+1} and x_k :

$$\mathbf{x}_{k+1} = \frac{1}{2} \left(\mathbf{x}_k + \frac{A}{\mathbf{x}_k} \right)$$

Denote the error $e_k = |x_k - \sqrt{A}|$, then the relation between e_{k+1} and e_k :

$$e_{k+1} = |x_{k+1} - \sqrt{A}| = \frac{1}{2} \left(\frac{x_k - \sqrt{A}}{\sqrt{x_k}}\right)^2$$
$$= \frac{1}{2|x_k|} e_k^2$$

A relation between x_{k+1} and x_k :

$$\mathbf{x}_{k+1} = \frac{1}{2} \left(\mathbf{x}_k + \frac{A}{\mathbf{x}_k} \right)$$

Denote the error $e_k = |x_k - \sqrt{A}|$, then the relation between e_{k+1} and e_k :

$$e_{k+1} = |x_{k+1} - \sqrt{A}| = \frac{1}{2} \left(\frac{x_k - \sqrt{A}}{\sqrt{x_k}} \right)^2$$
$$= \frac{1}{2|x_k|} e_k^2$$

◆□ ▶ ◆□ ▶ ◆三 ▶ ◆三 ▶ ● ○ ○ ○ ○

It can be shown that $0.5 \le x_k \le 1.0$.

Since the initial error $e_0 \leq 0.05$,

$$e_k \leq e_{k-1}^2 \leq \cdots \leq e_0^{2^k} \leq (0.05)^{2^k}$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

We have shown the convergence ($e_k \rightarrow 0$ as $k \rightarrow \infty$).

Since the initial error $e_0 \leq 0.05$,

$$e_k \leq e_{k-1}^2 \leq \cdots \leq e_0^{2^k} \leq (0.05)^{2^k}$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○ ◆

We have shown the convergence ($e_k \rightarrow 0$ as $k \rightarrow \infty$).

How fast? Rate: quadratic $e_{k+1} \leq ce_k^2$, each iteration doubles the accuracy.

Intro	Bisection	Newton	Systems	Optimization	Software	Summary
Term	nination					

Recall:
$$e_k \le (0.05)^{2^k} < 10^{-2^k}$$
.

Recall:
$$e_k \le (0.05)^{2^k} < 10^{-2^k}$$

When $k = 3$, $e_k < 10^{-8}$.
When $k = 4$, $e_k < 10^{-16}$.

Recall:
$$e_k \le (0.05)^{2^k} < 10^{-2^k}$$

When $k = 3$, $e_k < 10^{-8}$.
When $k = 4$, $e_k < 10^{-16}$.

Three iterations are enough for IEEE single precision (2^{-24}) . Four iterations are enough for IEEE double precision (2^{-53}) .

If $f(a) * f(b) \le 0$ and f(x) is continuous on [a, b], then f(x) has a root on [a, b].

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○ ◆

```
while (b-a)>tol
    m = (a+b)/2;
    if f(a)*f(m)<=0
        b = m;
    else
        a = m;
    end;
end;
r = (a + b)/2;</pre>
```

Two problems in the generic algorithm:

The while-loop may not terminate.

Two problems in the generic algorithm:

The while-loop may not terminate.

When a and b are two neighboring floating-point numbers and (b-a)>tol, (a+b)/2 is rounded to either a or b.

◆□▶ ◆□▶ ◆□▶ ◆□▶ ▲□ ◆ ○ ◆

Two problems in the generic algorithm:

The while-loop may not terminate.

When a and b are two neighboring floating-point numbers and (b-a)>tol, (a+b)/2 is rounded to either a or b.

Redundant function evaluations.

Intro Bisection Newton Systems Optimization Software Summary
An improved algorithm

```
fa = f(a);
while (b-a)>tol + eps*max(|a|, |b|)
   m = (a + b)/2;
   fm = f(m);
   if fa*fm<=0
      b = mi
   else
      a = m; fa = fm;
   end;
end;
r = (a + b)/2;
```

Intro Bisection Newton Systems Optimization Software Summary
An improved algorithm

```
fa = f(a);
while (b-a)>tol + eps*max(|a|, |b|)
   m = (a + b)/2;
   fm = f(m);
   if fa*fm<=0
      b = m_i
   else
      a = m; fa = fm;
   end;
end;
r = (a + b)/2;
```

Note: eps * max(|a|, |b|) is about the distance between two consecutive floating-point numbers near max(|a|, |b|). (ulp)

Since $b_k - a_k \leq (b - a)/2^k$, $x_* \in [a_k, b_k]$, and $x_k = (a_k + b_k)/2$, we have

$$e_k = |x_k - x_*| \le rac{b_k - a_k}{2} = rac{b - a}{2^{k+1}} \to 0$$

Exan	nple					

Step 1:

$$x_1 = x_0 - J^{-1}(x_0) f(x_0)$$

Step 1:

$$x_1 = x_0 - J^{-1}(x_0) f(x_0)$$

Solving for d_0 in $J(x_0)d_0 = f(x_0)$, we have

$$d_0 = \left[egin{array}{c} -0.5 \ 0.5 \end{array}
ight]$$

Thus

$$x_1 = \begin{bmatrix} 0\\1 \end{bmatrix} - \begin{bmatrix} -0.5\\0.5 \end{bmatrix} = \begin{bmatrix} 0.5\\0.5 \end{bmatrix}$$

Intro	Bisection	Newton	Systems	Optimization	Software	Summary
Exan	nple					

Step 2:

$$x_2 = x_1 - J^{-1}(x_1) f(x_1)$$
$$J(x_1) = \begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix}, \quad f(x_1) = \begin{bmatrix} 0 \\ -0.5 \end{bmatrix}$$

◆□ → ◆□ → ◆三 → ◆□ → ◆□ →

Solving for d_1 in $J(x_1)d_1 = f(x_1)$, we have

$$d_1 = \left[\begin{array}{c} -0.25\\ -0.25 \end{array} \right]$$

Thus

$$x_2 = \left[\begin{array}{c} 0.5\\ 0.5 \end{array} \right] - \left[\begin{array}{c} -0.25\\ -0.25 \end{array} \right] = \left[\begin{array}{c} 0.75\\ 0.75 \end{array} \right]$$

The *j*th column of $J(\mathbf{x})$

$$\begin{bmatrix} \frac{\partial \mathbf{f}_1}{\partial \mathbf{x}_j} \\ \vdots \\ \frac{\partial \mathbf{f}_n}{\partial \mathbf{x}_j} \end{bmatrix} = \frac{\partial \mathbf{f}}{\partial \mathbf{x}_j}$$

can be approximated by the difference

$$\frac{\mathbf{f}(\mathbf{x}_1,...,\mathbf{x}_j+\delta,\mathbf{x}_{j+1},...,\mathbf{x}_n)-\mathbf{f}(\mathbf{x}_1,...,\mathbf{x}_n)}{\delta}$$

$$\min_{\mathbf{x}\in S} f(\mathbf{x}) \quad \text{or} \quad \max_{\mathbf{x}\in S} f(\mathbf{x})$$

x: vector *f*(**x**): objective function and real-valued *S*: support

$$\min_{\mathbf{x}\in S} f(\mathbf{x}) \quad \text{or} \quad \max_{\mathbf{x}\in S} f(\mathbf{x})$$

x: vector *f*(**x**): objective function and real-valued *S*: support

Find a zero of the gradient

$$\nabla f(\mathbf{x}) = \begin{bmatrix} \frac{\partial f(\mathbf{x})}{\partial \mathbf{x}_1} \\ \vdots \\ \frac{\partial f(\mathbf{x})}{\partial \mathbf{x}_2} \end{bmatrix}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

View the gradient $\nabla f(\mathbf{x})$ as a vector-valued function and apply the Newton's method for solving nonlinear systems.

At current \mathbf{x}_c , find the correction \mathbf{s}_c :

 $\mathbf{x}_{+} = \mathbf{x}_{c} + \mathbf{s}_{c}$ where \mathbf{s}_{c} is the solution of

$$\nabla f(\mathbf{x}_c) + H(\mathbf{x}_c)\mathbf{S}_c = 0.$$

The matrix $H(\mathbf{x}_c)$ (the Jacobian of the gradient at \mathbf{x}_c) is called the Hessian of *f* at \mathbf{x}_c ($\nabla^2 f(\mathbf{x}_c)$):

$$H_{i,j}=\frac{\partial^2 f}{\partial x_i\,\partial x_j}.$$

Minimizing $f : \mathbb{R}^2 \to \mathbb{R}$:

$$f(\mathbf{x}) = \frac{x_1^3}{3} - x_1 x_2^2 + x_2.$$

Perform one iteration of Newton's method for minimizing *f* using the starting point

$$\mathbf{x}_0 = \left[\begin{array}{c} \mathbf{0} \\ \mathbf{1} \end{array}
ight].$$

Apply the Newton's method for finding a zero of the gradient

$$\nabla f(\mathbf{x}) = \begin{bmatrix} x_1^2 - x_2^2 \\ -2x_1x_2 + 1 \end{bmatrix}$$

The Hessian

$$H(\mathbf{x}) = \nabla^2 f(\mathbf{x}) = \begin{bmatrix} 2x_1 & -2x_2 \\ -2x_2 & -2x_1 \end{bmatrix}$$

Intro	Bisection	Newton	Systems	Optimization	Software	Summary
Exar	nple					

Step 1:

$$\mathbf{x}_{1} = \mathbf{x}_{0} - \nabla^{2} f(\mathbf{x}_{0})^{-1} \nabla f(\mathbf{x}_{0})$$
$$= \begin{bmatrix} 0 \\ 1 \end{bmatrix} - \begin{bmatrix} 0 & -1/2 \\ -1/2 & 0 \end{bmatrix} \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$
$$= \begin{bmatrix} 1/2 \\ 1/2 \end{bmatrix}$$
